

## **Suggestions for future work**

On the completion of any work the achievements, drawbacks as well as future scope of study need to be narrated. Present study is a petite attempt to investigate the unexplored thoughts of Chakrapani Datta in the consequence of specialty wise study in parlance to Modern Medical Science. The thesis illustrated the terminologies in the writings of Chakrapani Datta having clinical importance and highlighted the clinical contribution of Chakrapani Datta with special reference to Charak Samhita. Further studies are warranted to reassess the results and to explore the concept in those aspects which remained untouched. The tabulated data of important clinical terminologies is expected to fill the gaps in clinical knowledge of Ayurveda aspirants/learners and practitioners. Apart from basic terminologies and concepts of general medicine advocated by Chakrapani Dutta, the qualitative terminologies have also been arranged in respect to Anatomy, Physiology, Molecular Biology, Preventive and Social Medicine, Forensic medicine, Gynaecology / Obstetrics and Surgery. Thus present report adds information to the further development of aforesaid clinical fields. There is pressing need of further extensive works of drug and clinical research based on the leads provided by present compilations. By utilising knowledge generated by current study, many more therapeutic concepts can be nurtured and can be understood in easiest way to find out the true applied outcomes of our traditional Indian System of Medicine – Ayurveda.
